

Calc-PDA for Google's protocol buffers

Legend:

stack-val = topmost container stack value
cp = current position
acc = accumulator
field_num = field_number

lookup(x) = returns "string" or "container" by looking up the field_num "x" in the .proto file

State q_6 acts as a final state if and only if the following additional condition is fulfilled while q_6 is active:
stack.size==1
